

Base Doro

Seat with pommel wedge and side laterals to stabilize pelvis

Base Doro is a stabilizing seat with a prominent pommel wedge that enables abduction of legs and side laterals which stabilize the whole pelvis. It is an upgrade of Base Hilo cushion. Base Doro enables hips correction and stabilization of the entire pelvis. Moreover side laterals of the cushion reach above the hip girdle, correcting it and relieving its pressure at the same time.

Product features

The shape of cushion allows to increase torso control among users who feel its lack while sitting on regular cushions.

Possibility of simultaneous hip correction and stabilization of the entire pelvis provides an impulse for active users to increase torso movement during daily activities, thus indirectly increasing the strength of certain skeletal muscle groups.

For people with hip dislocation and hip rotation, the cushion provides comprehensive stabilization, prevents the aggravation of deformity, increases the comfort of daily activities, and often reduces pain.

The side laterals of the cushion reach above the hip girdle, thus perfectly stabilising it in a given position, correcting and relieving its pressure at the same time.

Accessories

Included

- Hand pump
- Neoprene strap

Additional

- Electric pump
- Mounting strap
- Flexible cover with foam
- Tubo
